

PROJECT: STUDENT MARKS ANALYSIS

FINDINGS

Note: The dataset uses random numbers for marks and this report is based on the numbers generated randomly while working)

1. Average score of students in English is slightly higher than other subjects, but overall, its less than 50%
2. Only one student scored more than 90 in Maths, her name is Sneha and score: 95
3. Two categories of marks found. The distribution of marks are bi model. One group of students is doing good in Maths, while another group of students are performing low.
4. There was no missing values anywhere.

RECOMMENDATIONS

1. Principal might want to investigate why a group of students has performed low.
2. Is it consistently low? Need data for previous exam marks for further investigation.
3. Reward can be given to top performers to keep them motivated.
4. Monitor performance levels in maths continuously by evaluation.
5. Facilitate additional support to weak performers
